With an ever increasing possibility of foreign or domestic violence in the industrial setting it is important that tactical response teams be very familiar with the differences in the outside civilian world and the industrial petro/chemical setting. The presence of very dangerous hazardous materials, high pressure vessels, high temperature dryers, steam lines, and ever tightening plant security measures could make

a huge difference in the tactics that may need to be employed by any tactical response team.

From studying how an industrial site is laid out to the types of chemical protective clothing and their limitations, we offer the ability to practice your response craft and procedures in a safe, "real world" industrial setting. BE Prepared for Every Situation!
